Vocabulary

mystery science

Lesson: Why do plants grow flowers?

flower	the reproductive part of some plants that can make seeds
model	a pretend version of something that scientists use when the real thing is too big, small, or complicated to work with
nectar	a sugary liquid that plants make
offspring	babies
pollen	a part of a flower that is powdery and helps the plant make seeds
pollination	the process of moving pollen from one part of a flower (the stamen) to another part of a flower (the stigma)
reproduction	a stage in the life cycle of living things when they have offspring
seed	a part of a plant that can grow into a baby plant
stamen	the part of a flower that has pollen
stigma	the sticky part of a flower that pollen can stick to
